

AETHER 360 | PATIENT & MEMBER 360

Cited clinical and regulatory document copilot

Team Name: Aether 360

Team Leader Name: Gopal Kanase

Team Size: 2 | Gopal Kanase, Pramoda Devi B

Problem Statement: Connect synthetic records to evidence-cited care decisions.

CHALLENGE: Patient and Member 360 and Clinical or Regulatory Document Copilot

1. Problem brief

Fictional Aether Care Alliance; every member, claim, note and document in this prototype is synthetic.

BUSINESS PROBLEM

Care teams work across separate EHR, payer-claims and policy/document systems. Risk and coverage answers are slow to assemble and difficult to audit.

TARGET USERS

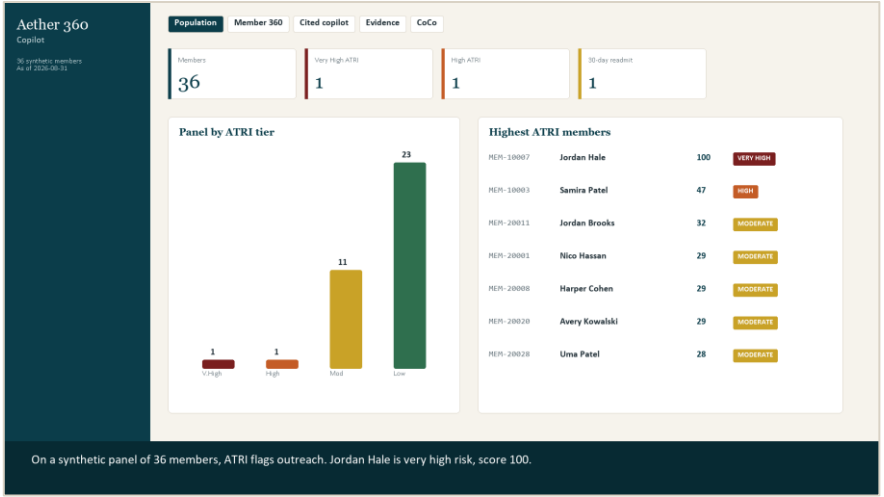

Care managers, clinical pharmacists, prior-authorization nurses and quality teams.

CURRENT PAIN > PROTOTYPE RESPONSE

Fragmented records and unsupported answers > one member view, a source-linked ATRI factor ledger, cited document retrieval, and an explicit abstain/refuse path.

DOMAIN

Healthcare operations and clinical / regulatory evidence review. This prototype is not medical advice or a production clinical service.

WORKING LOCAL STREAMLIT PROTOTYPE > SAMPLE DATA ONLY

36	41	16
members	claims	documents

2. Architecture & CoCo workflow

Prototype data path and intended CoCo lifecycle; the Snowflake warehouse / Cortex Agent are not represented as deployed.

CoCo CLI lifecycle prompts

Planning > Development > Execution > Testing | Prompts numbered 01 to 04

Synthetic sources

EHR + payer CSVs
Clinical / policy Markdown

Conform & prepare

Crosswalk + normalized data
Silver tables / document chunks

Explain & retrieve

MEMBER_360 + ATRI factors
Clinical / regulatory evidence

Local app

Member 360
Cited answer / abstain

LOCAL PROTOTYPE > Python data / retrieval modules + Streamlit UI; citations point to synthetic source rows and document chunks.

Planned Snowflake path

SQL scripts describe AETHER_CARE bronze > silver > gold, Cortex Search / Agent and Streamlit integration.

CoCo skill references

Project prompts name synthetic-care-data, patient-360-builder, cited-clinical-qa and risk-strat-explainer.

Transparency: skill definitions and a CoCo CLI execution recording are not included; the named skills are prompt references, not claimed as run.

3. Impact statement

Measured prototype scope from the bundled synthetic corpus; operational time / accuracy impact has not yet been measured.

36
synthetic members

41
synthetic claims

16
synthetic documents

7 / 7
unit tests passing

DEMONSTRATED CAPABILITIES

Explainable risk

Rule-based ATRI factor points display their source objects and evidence.

Evidence-first answers

Retrieved examples show citations; missing support can abstain; real-person lookups are refused.

Reusable delivery path

Python app, SQL deployment sequence, CoCo prompts, MCP server and guardrail hook are in the repo.

NEXT-PILOT MEASURES

Track care-gap review time vs. baseline, citation correctness, abstention/refusal correctness and workflow completion with domain reviewers. Scale by adding governed sources and evaluating each connector; no clinical efficacy or savings are claimed.

Prototype workflow | 3 modular capabilities

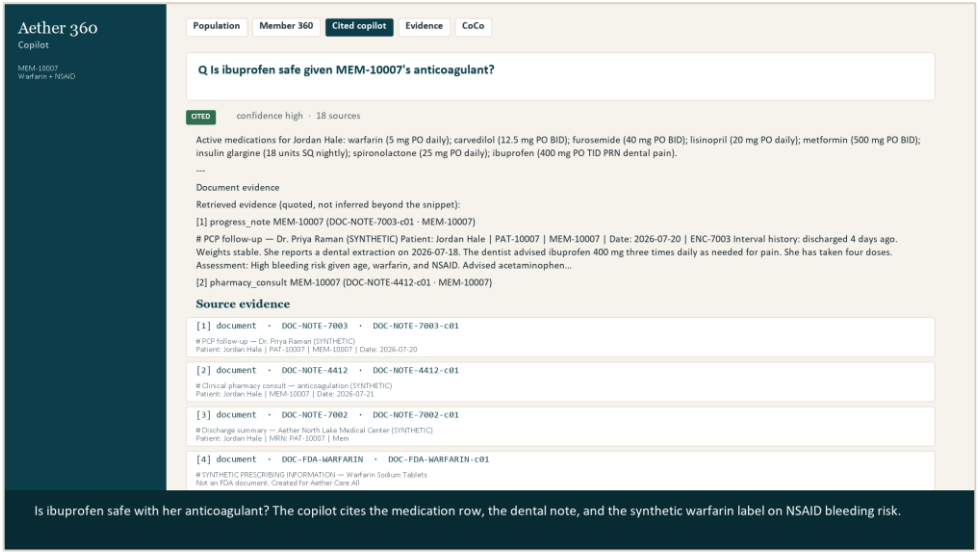

Synthetic example: review a medication-safety question with Jordan Hale; all member identifiers shown are synthetic.

1 Select
Synthetic member

2 Explain
ATRI + source rows

3 Retrieve
Notes + policy chunks

4 Respond
Cite / abstain / refuse

Narrated prototype walkthrough (1:54; not a CoCo CLI screen recording):
https://raw.githubusercontent.com/gplkanase/aether-360-copilot/main/docs/demo/Aether360-demo.mp4

01 > ATRI risk explanation

aether360/risk.py implements a transparent, rule-based factor ledger.

02 > Cited clinical QA

aether360/qa.py retrieves synthetic notes / labels and cites evidence or abstains.

03 > Care-ops action

Local MCP exposes synthetic care-gap tickets / safety-review workflows; guardrails constrain unsafe SQL.
